How it can work:

- Devise an algorithm that can discern real accounts from botted/automated accounts

  David Doughty

- Can be condensed into a single browser extension (or can be coded into something like Tampermonkey?)

  David Doughty

- Program should automatically block any botted accounts that interact with the user

  David Doughty

- User should be able to access a list of blocked accounts through the program should it malfunction and block a real user

  David Doughty

Potential hurdles:

- Creating this algorithm may be complicated

  David Doughty

- Can the code really be that condensed to be put in a single Tampermonkey script?

  David Doughty

- Perhaps the user could be prompted with a suggestion that the account interacting with them is a bot?

  David Doughty

- Must account for a large number of blocked account as it can grow to become very large

  David Doughty

Advertisement + marketing

- Program will be free to use (with optional donations)

  David Doughty

- Can be advertised via Twitter itself to reach users easier

  David Doughty

- Can also be advertised on other social media sites

  David Doughty

- YouTube demo video

  David Doughty

Support for users

- Can create a support Discord for users that need assistance with the program for any reason

  David Doughty

- Discord can be used for bug reports and feedback

  David Doughty

- Create a support email

  David Doughty

- Can also offer support via Twitter DMs

  David Doughty

Application type explorations

- Tampermonkey extension code

  David Doughty

- Separate extension with its own code

  David Doughty

- The above two ideas are likely the only viable options, as creating an application would be tedious

  David Doughty

- If push comes to shove create an app

  David Doughty
